AutoCAD has received widespread commercial usage, with over 50 million copies shipped worldwide. History [edit] AutoCAD was developed by Bentley Systems and released as a freeware program in December 1982, under the name Bentley Graphics Program. It was the first commercially viable CAD package that could be run on a personal computer. The first version was run on a 3MHz Intel 8088 microprocessor, with memory capacity of 6 Kbytes. The program was marketed as an inexpensive alternative to the expensive, complex and often proprietary IBM-based CAD packages that were available at the time.[1] The program began life as a graphics application, designed to aid in the preparation of schematic, drafting and engineering drawings. The program was developed for and marketed to automotive, machinery, construction and architectural firms. It also became popular with hobbyists and enthusiasts of the then new desktop personal computers, such as the Apple II, the Tandy 1000 and the Atari 800.[2] Initially the user interface (UI) was very basic, with a small task bar at the top of the screen, containing the commands to exit the application, open files, save files and print files. The program was also intended to run in the background as a design assistant, allowing other applications to continue functioning on the computer. A small menu on the task bar was used to change from the "Roadmap" mode, to the "Type" mode and "Dimension" mode. The roadmap icon The roadmap icon on the left of the screen was used to change the "Roadmap" mode, to the "Type" mode and the "Dimension" mode. The first version of AutoCAD was very slow and command-driven, requiring the user to enter commands by typing in text, by selecting icons from a menu or from a keyboard macro. The graphical interface was used in the earlier versions of AutoCAD to create the architectural and engineering drawings that were prepared by the user. Only one file could be open at any time, and the user would have to close one file and open a new one to start a new drawing. The user would select the icon that was to be used to create the new drawing, and then would open the file and enter the commands needed to set up the new drawing. This was tedious and took a long time, particularly for large drawings. To speed up the program, the user interface was
