## What's New in the?

Canon Driver Configuration Tool is a small program designed to aid individuals in configuring their printer drivers so that the product can be used at its full potential. A5-based drivers come installed with the device, but the settings and settings of the device can be specified by the user. These settings can be entered through a simple interface or through an INF file, depending on the user's wishes. With the increase of printer use due to more and more bureaucracy, it only makes sense to create configurable drivers for this type of hardware in order to have instant access to your much-needed settings or preferences. This is exactly the case with Canon Driver Configuration Tool, a small program designed to aid individuals in configuring their printer drivers so that the product can be used at its full potential. In theory, this means you'll have to install your product's driver and only afterwards run this program in order to further adjust settings and parameters. Let's pretend you print only A5 format paper and would like to have this as the standard option instead of having to change the paper setting each and every time you run your printer. With this tool, all you have to do is navigate to the source of the driver and simply hit the OK button for further adjustment options. If you've got an INF file at hand, you could specify that as well by clicking on the only checkbox in the application. The basic look of the program was to be expected if we are to take into consideration the fact that this is a tool before anything else. It does not provide any other function other than Canon printing driver customization. Comments Hardware monitors can be loaded by default, and the motherboard is not guaranteed to support all the hardware for which a driver exists on the computer. Even for the cases where the hardware in question is supported, this is a non-optional process. The easiest way to get a driver installed is to use the Windows device manager (Start | Run | devmgmt.msc). Check for any hardware with the yellow exclamation mark next to it. Click "Installed" in the list of "New Hardware". When you go to the driver tab, you can see the driver(s) associated with the device(s) you have found. Click "Details" on the driver tab, and it will tell you what files are used by the driver. When you are familiar with the files, you can use the Windows file search for the files. Find the "driver.inf" file in the list of files with the right name and extension, and open it with notepad. At the top of the notepad file, it will tell you the file version and the name of the driver. You can
